

Hello,

I have read information concerning BPL proposal and would like to state that the studies that I have seen, indicate that this would cause considerable interference to many modes of radio transmission, in particular Amateur Radio and FAA radio traffic near airports especially during take off and landing.

Additionally, I have not seen any studies done on the environmental impact of the additional RF exposure that would be introduced upon the population. While the exposure might be low, it would seem that most people would now be exposed on continuous basis.

For these reasons, I oppose this proposal at this time until further study has been done on these issues.

Thank you,
Don West
